Supplier performance analysis report

Supplier 1 | Analysis period: 1 Oct 2026 to 14 Oct 2026 | W1: 1–7 Oct | W2: 8–14 Oct

This report rebuilds the vendor-level analysis in English for PDF use. It prioritizes directly observable period changes, campaign contribution, inventory risk exposure, and source consistency checks from the supplied file.

Executive conclusion

W2 outperformed W1 on top-line ad sales and ROAS, with direct arithmetic indicating ad sales rose from 8.0M KRW to 9.0M KRW while spend stayed flat at 5.0M KRW. The strongest visible gain sits in Sample campaign004 and the efficiency leader is Sample campaign003, but the portfolio still carries material stockout risk concentrated in a few products, and several source claims conflict with the base values. The practical implication is to protect W2 momentum through inventory recovery first, then validate any budget recommendation whose before-and-after values do not actually change.

W2 sales up | Spend flat | Inventory risk concentrated | Source figures require verification

KPI summary

Ad sales

₩9,000,000

W1 8,000,000 KRW | W2 9,000,000 KRW | +₩1,000,000 (12.5%)

ROAS

177%

W1 169% | W2 177% | +8pt

Ad spend

₩5,000,000

W1 5,000,000 KRW | W2 5,000,000 KRW | No arithmetic change

Impressions

1,000,000

W1 900,000 | W2 1,000,000 | +100K (11.1%)

Conversion rate

3.5%

W1 5.2% | W2 3.5% | -1.7pt

Budget-exhausted campaigns

1

W1 2 | W2 1 | 1 fewer constrained campaign

The KPI grid uses direct W1 and W2 values from the source arrays. Where the underlying source narrative reported a different change figure from the arithmetic implied by W1 and W2, the inconsistency is surfaced later in a dedicated verification section.

Performance interpretation

Portfolio sales by campaign: W1 vs W2

Across the campaigns visible in the source data, Sample campaign004 shows the clearest period expansion, doubling from 1.0M KRW in W1 to 2.0M KRW in W2. Sample campaign003 remained large in both periods at 2.0M KRW, while Sample campaign010 appears as a newly active campaign with no W1 base and 90,000 KRW in W2. This matters because the portfolio uplift is concentrated rather than broad-based, so sustaining growth depends on protecting a small set of high-contribution campaigns rather than assuming uniform improvement across the account.

Campaign comparison details

Campaign	ID	Type	W1 sales	W2 sales	Source claim	Contribution	Spend	ROAS	Target	Attainment
Sample campaign004	CAMP_004	MPS	₩1,000,000	₩2,000,000	+1,000,000 KRW	98.7%	₩2,000,000	200%	254%	78.6%
Sample campaign003	CAMP_003	MPS	₩2,000,000	₩2,000,000	+300,000 KRW	35.2%	₩1,000,000	383%	294%	130%
Sample campaign010	CAMP_010	MPS	₩0	₩90,000	+90,000 KRW	9%	₩60,000	165%	300%	54.9%

The side-by-side table is useful because several source claims cannot be validated from the visible W1 and W2 values alone. For example, Sample campaign003 carries a source claim of +300,000 KRW while its visible W1 and W2 sales are both 2.0M KRW, so any incremental explanation should be treated as original-source context rather than arithmetic fact until the underlying extraction logic is confirmed.

Efficiency and target attainment

Campaign ROAS vs target

ROAS attainment by campaign

Sample campaign003 is the only listed campaign clearly above target, at 383% ROAS against a 294% target and 130.0% attainment, while Sample campaign004 and Sample campaign010 trail their targets at 78.6% and 54.9% attainment respectively. The implication is not that all growth deserves more budget; it is that efficiency is uneven, and only campaign003 has visible target-beating economics in the supplied data. Even there, the recommended budget action requires verification because the cited before-and-after budget values are identical, so the operational recommendation is to confirm the recommendation object before presenting it as an actual increase.

Inventory risk and exposure

Products with visible stockout risk

5

Recent 2-week source scope

Total estimated sales at risk

₩4,200,000

Derived from visible risk rows

Longest visible stockout

137h

VID_0019 | Sample product001

Estimated sales risk by product

Stockout hours by product

Inventory risk is concentrated and material: the visible products sum to ₩4,200,000 of estimated sales risk, led by VID_0019 at ₩2,000,000 and 137 hours out of stock over the stated recent 2-week period. VID_0022

and VID_0013 add further exposure, while VID_0018 links risk to multiple campaigns, including a low-utilization campaign mentioned elsewhere in the source. This is why inventory is the first portfolio-level lever: stock availability is a directly evidenced constraint, whereas several performance explanations and budget actions in the source remain partly unverifiable from the base values alone.

VID_0019 | Sample product0019 — 2,000,000 KRW risk

Out of stock: 137h | Period label: Recent 2 weeks 137h

Linked campaign(s): CAMP_062 — Sample campaign062 (MPS) | CAMP_047 — Sample campaign047 (MPS)

Action from source: Most severe out-of-stock in the portfolio (137h). Estimated ad sales risk over 2 weeks: 2,000,000 KRW. Urgent FBA replenishment is needed.

VID_0022 | Sample product0022 — 1,000,000 KRW risk

Out of stock: 115h | Period label: Recent 2 weeks 115h

Linked campaign(s): CAMP_003 — Sample campaign003 (MPS)

Action from source: Out of stock for 115h on a VID contributing 13.8% of the advertiser's ad sales; estimated risk 1,000,000 KRW. Replenish FBA inventory to restore normal campaign delivery and ROAS contribution.

VID_0018 | Sample product0018 — 500,000 KRW risk

Out of stock: 47h | Period label: Recent 2 weeks 47h

Linked campaign(s): CAMP_062 — Sample campaign062 (MPS) | CAMP_047 — Sample campaign047 (MPS)

Action from source: Out-of-stock time detected for a VID accounting for 20.6% of the advertiser's ad sales. Replenish FBA inventory promptly to prevent continued ad sales risk.

VID_0013 | Sample product0013 — 500,000 KRW risk

Out of stock: 92h | Period label: Recent 2 weeks 92h

Linked campaign(s): CAMP_004 — Sample campaign004 (MPS)

Action from source: Out of stock for 92h on a VID contributing 13.3% of the advertiser's ad sales; estimated risk 500,000 KRW. Replenish FBA inventory to sustain the sales recovery trend observed in W2.

VID_0021 | Sample product0021 — 200,000 KRW risk

Out of stock: 35 hours | Period label: Out of stock for 35 hours in recent 2 weeks

Linked campaign(s): CAMP_003 — Sample campaign003 (MPS)

Action from source: Out of stock for 35 hours; expected loss 200,000 KRW. This product drove an increase in ad sales for the Sample campaign003 campaign after the stockout was resolved, and continued inventory management is important to sustain this performance.

Ranked actions and confidence

The actions below preserve the source ranking but separate what is directly supported by visible numbers from what needs verification. Where the source proposes a budget increase with no actual numeric change, the recommendation is shown as a verification item rather than an unquestioned growth lever.

1. CAMP_003 budget recommendation

Verification needed

Original action: **Sample campaign003 (CAMP_003):** Increase daily budget from 100,000 KRW to 100,000 KRW

Evidence: In period W2, full-day OOB occurred 7 days ago (8-hour cap reached; utilization 98.8%). ROAS 410% vs. target ROAS (T.ROAS) 294% — efficiency is strong and budget is the key constraint. Sample recommendation service recommendation date: 2026-10-15.

Priority	High
Evidence quality	Mixed: strong ROAS evidence, contradictory budget delta
Uncertainty	The recommended budget is 100,000 KRW before and after, so the visible numbers show zero change
Next step	Confirm whether a revised budget value exists in the source system before positioning this as an increase

2. CAMP_047 low utilization review

Operational review

Original action: **Sample campaign047 (CAMP_047):** Review whether the campaign is intentionally showing low delivery

Evidence: Daily budget 500,000 KRW; utilization was only 2.5% over the past 7 days. There is currently no recommendation the seller can take directly. Before considering budget or bid action, the AE should confirm whether the low delivery is due to eligibility constraints (reference: active out-of-stock time exists for VID VID_0018 and VID_0019).

Priority	High
Evidence quality	Moderate: utilization is explicit, cause is not proven
Uncertainty	Low delivery may reflect eligibility limits, but the exact mechanism is not demonstrated in the visible campaign data
Next step	Review product eligibility and stock position for VID_0018 and VID_0019 before altering budget or bidding assumptions

3. CAMP_009 monitor utilization

Monitor

Original action: **Sample campaign009 (CAMP_009):** Monitor the utilization trend

Evidence: Daily budget 100,000 KRW; utilization 45.5% — moderate, but below full delivery. There is currently no recommendation the seller can take directly.

Priority	Medium
Evidence quality	Limited: utilization is below full delivery, but no direct seller action is provided
Uncertainty	No supported causal diagnosis is available from the supplied data
Next step	Track whether utilization weakens further or recovers before escalating to a structural intervention

Source consistency check

Source figures require verification

Several original claims do not match the direct arithmetic implied by W1 and W2 values. These inconsistencies should be treated as reporting or extraction issues until the original workbook or system logic is reconciled.

Claim vs direct arithmetic

Metric	W1	W2	Original claim	Calculated difference	Calculated %	Assessment
Ad sales	8,000,000 KRW	9,000,000 KRW	+800,000 KRW (+10.1%)	+₩1,000,000	12.5%	Source figures require verification
ROAS	169%	177%	+8%p (+4.7%)	+8pt	4.73%	Arithmetic aligns or is directionally consistent
Ad spend	5,000,000 KRW	5,000,000 KRW	+200,000 KRW (+5.1%)	₩0	0%	Source figures require verification
Impressions	900,000	1,000,000	+100,000 (+19.4%)	+₩100,000	11.11%	Source figures require verification
Click-through rate	0.6%	0.8%	+0.2%p (+47.9%)	+0.2pt	33.33%	Source figures require verification
Conversion rate	5.2%	3.5%	−2.0%p (−32.4%)	-1.7pt	-32.69%	Source figures require verification
Average order value	30,000 KRW	20,000 KRW	−2,000 KRW (−7.8%)	-₩10,000	-33.33%	Source figures require verification

Metric	W1	W2	Original claim	Calculated difference	Calculated %	Assessment
Number of campaigns	6	6	0	0	0%	Arithmetic aligns or is directionally consistent
Number of budget-exhausted campaigns	2	1	−1	-1	-50%	Arithmetic aligns or is directionally consistent

The most material visible mismatches are Ad sales, Ad spend, Impressions, Click-through rate, Conversion rate, and Average order value. For example, Ad sales move from 8.0M KRW to 9.0M KRW, which directly calculates to +1.0M KRW and +12.5%, not the original +800,000 KRW and +10.1%; Average order value moves from 30,000 KRW to 20,000 KRW, implying a 10,000 KRW decline rather than the much smaller drop stated in the source claim. Because these are source-level inconsistencies rather than analytical estimates, the safest reporting posture is to preserve the original claim visibly, show the direct arithmetic beside it, and avoid silently correcting the narrative.

Original-source evidence and scope

Source sections represented

- Section 1 — KPI summary
- Section 3A/3B — Campaign change diagnosis
- Section 4 — OOB budget context
- Section 5 — Low utilization review
- Section 7B — Inventory eligibility and stockout risk

Visible campaign scope

3 campaigns in structured campaign data: CAMP_004, CAMP_003, CAMP_010

5 products in structured inventory risk data: VID_0018, VID_0019, VID_0022, VID_0013, VID_0021

Interpretation limits

- No campaign-level CTR, CVR, CPC, or AOV histories were provided in the structured arrays.
- No unsupported cause has been added where the source offered only hypothesis.
- Recent 2-week risk periods are kept as labelled source periods and not relabelled as W2.

This PDF view is intentionally static and self-contained. All numbers, IDs, periods, and recommendations shown here come from the server-provided source arrays or direct arithmetic based on them; where the narrative file referenced additional context not available in those arrays, that context is preserved as original-source evidence rather than promoted to validated fact.
